

Dynamic Systems Do you need truly dynamic systems? Even when you cannot define the degree of dynamic to be passed on to the user, there's now a robust way to develop your system! The RISE is the obvious choice in how to get there. Let the user redefine the system within the system! You decide; you're in control; they can let the system evolve with the business. Read more in the Dynamic System Development on the RISE™ Brochure.

Spending your time maintaining the results of earlier projects, just because nobody else knows how to? Does profit from your skills and knowledge get eaten up by demands you cannot ignore or charge for? Did you know there's a brochure on how Quality Consulting on the RISE™ lets you turn your project track record into an asset for you and others?

Software Developer Want to know how you can develop in a faster and better way? Does building more robust applications with fewer resources, still finishing before time sound utopian to you? Now RISE lets you do just that! Using the RISE Software Suite empowers you to develop not only the data layer of your software but even the application layer, through a powerful ERD-interface. And not only that: it allows you to update and maintain your systems in use. Read more in the Software Development on the RISE™

RISE for
Business
Decision Makers

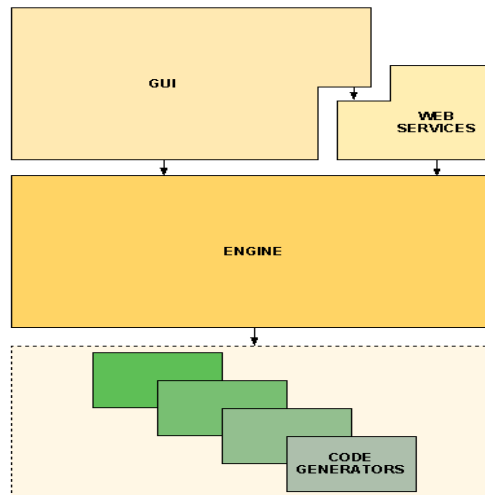

Surely, you already know your business intelligence should guide your technology decisions instead of the other way around. Do you also know that there are now tools that empower you to take that active part in the designing and managing of your business applications? If you know the business, why not transform it into more efficient, cheaper, and more robust business support solutions?

Even without programming skills you can now design the whole information model needed for your business application. Draw the diagram and let RISE generate or update your database. It is even possible to get the application layer functions generated straight out of your model drawing interface!

Make your business Bloome!

Instead of spending time and resources on translating business needs into technical terms to get your applications coded more or less from scratch, you provide the information and the RISE Engine generates the results. Standardized error free code in the whole core solution gives you not only a quick and economical implementation but also renders a significantly more robust end result.

A unique feature of RISE is the possibility to not only create a data model based application but, and at least as importantly, to maintain and update the solution as the business evolves and its conditions change. Simply, keep your business systems solutions around the globe, up to date, every day without delay!

Schematic presentation of the RISE architecture.

Using RISE lets you advance from inefficient, costly IT solutions to the agility and robustness you should expect from your IT. The right tools empower your people to use the information to create the applications your company needs.

Optimize your IT systems to reach your business goals!

- Making - RISE software can help you cut costs and make money by letting you aim resources at your business' real needs instead of huge ineffective development projects and time consuming systems management.
- Trusting - using RISE software gives you the robustness you need to trust the IT solutions your business depends so heavily upon.
- Saving - RISE software can help you save time implementing your solution faster by letting your business intelligence truly drive the process.

The RISE Software Suite™ is an extremely powerful, yet easy-to-use set of tools enabling you as a business decision maker to transform your business intelligence into information model based databases, application layers and more.
