

Dynamic Systems Do you need truly dynamic systems? Even when you cannot define the degree of dynamic to be passed on to the user, there's now a robust way to develop your system! The RISE is the obvious choice in how to get there. Let the user redefine the system within the system! You decide; you're in control; they can let the system evolve with the business. Read more in the Dynamic System Development on the RISE™ Brochure.

Want to know how you can make your business knowledge guide your technology decisions instead of the other way around? RISE to Bloome offers the tools and concepts that put you in control of the development and maintenance of your IT solutions based on your business knowledge! Read more in the RISE for Business Decision Makers brochure.

Software Developer Want to know how you can develop in a faster and better way? Does building more robust applications with fewer resources, still finishing before time sound utopian to you? Now RISE lets you do just that! Using the RISE Software Suite™ empowers you to develop not only the data layer of your software but even the application layer, through a powerful ERD-interface. And not only that: it allows you to update and maintain your systems in use. Read more in the Software Development on the RISE™.

Quality
Consulting on
the RISE™

Do you spend your time maintaining the results of earlier projects, because nobody else knows how to? Does your profit get eaten up by infinite customer demands?

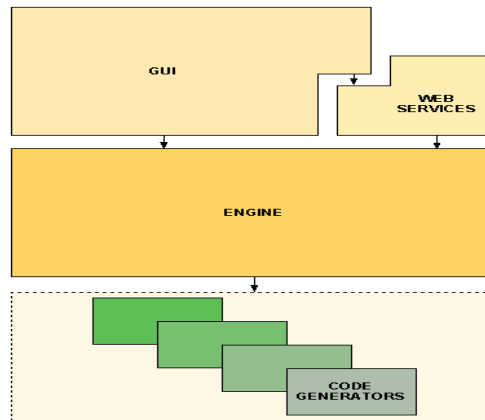

As a consultant you often face difficulties with customer's not being able to distinguish between sold and delivered resources in terms of time and competence and the resulting software and business solutions. This may harm customer relations and cause revenue loss since they may pose unrealistic demands on continued management of their results in spite of your having already delivered all that they have bought.

Development on the RISE™!

Your delivering unfortunately often means that your competence and specific knowledge of a customer's solution is mistaken for responsibility for their system. Absurd as it may seem, this means that your assets are turned into liabilities.

The basis of this problem is often an inadequate transfer of results to the customer. They may not realize that the delivery is finished and the result is theirs to assume responsibility for. As long as they see you as the only one who can possibly manage or develop it, they will

tend to view it as your responsibility rather than something that you may choose to offer them. This means that what you would need is a delivery by which they not only understand that it has been delivered but also that they see a more general possibility to manage and develop it.

Schematic presentation of the RISE architecture.

This is all fine in many large scale projects where the turning over results, be it code or documentation, is made part of the sold project. In many situations this is not possible to sell to the customer and therefore not feasible to deliver. So, you are still stuck with being the expert who's competence and knowledge is taken for granted!

Wouldn't it be great if you instead could turn your project track record into an asset? With RISE you can take your productivity within your developing projects to a whole new level but not only that; you can also turn the results over in a form that the customer can understand and use. Keep track of all your solutions in a way where you can actually manage them! You can pick up where you left off even for old projects, minimizing the startup overhead.

With the same set of tools that help you develop the solution in the first place, you or somebody else can easily change, add to and update, in real time, even in systems in use. In short; save time and money while improving the quality and reliability of your models and applications as well as your deliveries! Suddenly you can sell added value of your competence to satisfied customers getting results they feel comfortable with owning.

That's what we call quality consulting!
