Business Decision Maker Want to know how you can make your business knowledge guide your technology decisions instead of the other way around? RISE to Bloome offers the tools and concepts that put you in control of the development processes and maintenance of your IT solutions based on your business knowledge! Read more in the RISE for Business Decision Makers brochure.

Spending your time maintaining the results of earlier projects, just because nobody else knows how to? Does profit from your skills and knowledge get eaten up by demands you cannot ignore or charge for? Did you know there's a brochure on how Quality Consulting on the RISE™ lets you turn your project track record into an asset for you and others?

Software Developer Want to know how you can develop in a faster and better way? Does building more robust applications with fewer resources, still finishing before time sound utopian to you? Now RISE lets you do just that! Using the RISE Software Suite™ empowers you to develop not only the data layer of your software but even the application layer, through a powerful ERD-interface. And not only that: it allows you to update and maintain your systems in use. Read more in the Software Development on the RISE™ brochure.

Dynamic Systems Development on the **RISE™**

When you need truly dynamic systems RISE comes to your aid. Even when you cannot, beforehand, define the degree of dynamic to be passed on to the user, there is now a robust way to develop your system!
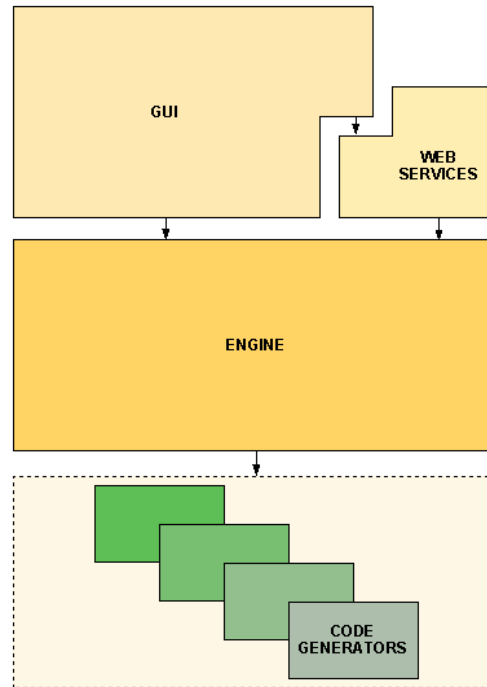

Simply define what parts or sub-models, if any, you will let the users change or add to. Since they don't have to do any programming this means you can reduce the tedious and costly iterations between the user-end detail specifying and changing according to business needs and the developers with skills including programming.

Development on the RISE™!

When the business change and a need arises for, let's say, a new attribute field for an existing object or even an all new object or set of objects; the users granted access can graphically change the model and update the system. This could be e.g. a system administrator or an end user, all depending on whom you have given access.

This also means that you can develop an application open to the customers' changes and additions without jeopardizing the core of the solution.

Maybe your business is exactly that: to supply a robust yet dynamic application core with a sample application and front-end for the customers to rework according to their specific needs.

Schematic presentation of the RISE architecture.

Maybe your business is providing access to a core model as a service where one or more client applications can access relevant parts not only for use but changes and additions as well; again, without jeopardizing the robustness of the core.

Need to redefine the system? Redefine within the system!

- Maximum agility, maximum robustness!
- RISE software lets you aim resources at the development of your core application instead of the constantly changing business implementations of it.
- RISE software gives you the robustness you should expect of all your core applications.

The RISE Software Suite™ is an extremely powerful, yet easy-to-use set of tools enabling you as a system developer to create robust systems letting you empower your business intelligence experts to make additions and changes to any parts you delegate.
